Summary of Coursework Breakdown
(as stated in course structure)

No	Description of coursework	Learning Outcomes covered	Marks allocated
1	Group Assignment	CLO3	40%
2	Online Assessment	CLO2	20%
3	Individual Assignment	CLO1	40%
	Contribution of the coursework to the course		**100%**

Penalty for late submission

1 day – minus 20% of total mark awarded.
2 days – minus 50% of total mark awarded.
3 days – 0 mark for this piece of coursework.

Note: Plagiarism & Copying

Plagiarism and copying are strictly prohibited AND CONSIDERED A SERIOUS OFFENCE. THE FACULTY HAS THE FULL RIGHTS TO TAKE DISCIPLINARY ACTIONS AGAINST ANY STUDENT WHO PLAGIARISE OR COPY THE WORK OF OTHERS. AN ACCEPTABLE 'TURN IT IN' REPORT MUST BE INCLUDED AS APPENDIX FOR ALL SUBMITTED ASSIGNMENTS. THE TOTAL PERCENTAGE IN THE REPORT SHOULD LESS THAN 25% and EACH INDIVIDUAL ITEM IN THE REPORT SHOULD LESS THAN 3%. Your assignment will NOT BE GRADED if it does not meet the above threshold.

The faculty reserves the right to use any means to identify plagiarism and copying. If you reference the work of other authors, you must ensure that you properly reference them to avoid the charge of plagiarism.

Copying the work of others (current students, past students, or the works of others) automatically earns you a Fail grade. If two or more students copied from each other, both students (regardless of who copies from whom) will earn a Fail grade.

1.0 Introduction

Users' satisfaction and efficacy when they use a social media platform are directly dependent on its user interface (UI) and it's now already a part of everyday life for billions of people. One of the largest social network websites in the world with more than **3.07 billion** users per month (as of 2025) (DataReportal, 2025). With so various types of users, and millions of them, minor usability (or UX) problems with the interface can affect millions of people every day. Hence, it is essential to recognise the users satisfaction and identify any flaws or issues within the design to enhance user interaction with the platform.

This study is a Human Computer Interface (HCI) study pertaining to the interface of the Facebook website. The following analysis is to determine the level of satisfaction among current users with website design of Facebook, determine the design features which are highly dissatisfying with the users and finally to derive out a new prototype design which is directly derived from the users opinion of the existing design. They chose to test nine core interface pages to study: Login Page, Registration Page, Home Feed (Dashboard), Profile Page, Friend Request Page, Message Page, Notifications Page, Settings Page, and Create Post Page.

To collect reliable evidence, a close ended questionnaire was created in Google Forms and sent to 30 respondents. It gauged how happy respondents are with each of the nine pages as well as issues and potential improvements for each page. To support the redesign of selected pages in Figma, the quantitative results were then used to validate if the changes yielded a positive increase in user satisfaction with a retest of the pages. In this paper they present the whole journey, from conducting UCD, developing the H, interaction design and conducting the Usability Testing in to the final prototype development and outcome evaluation.

2.0 User Experience (UX) Research

2.1 User Behaviours and Attitudes

Target Audience

The target group of this study is young adults who use the web page of Facebook as majority is higher university students and working adults (18-35) years old. This group was chosen because they spend lots of time on the Internet, are not afraid to give specific feedback in regards to digital products and are a sizeable and active portion of Facebook reimbursed real consumer base. The respondents included in this survey were 30 aged generally from 19-26 years, most of who used the website version of Facebook on a daily or weekly basis.

Website Goal

Facebook's main purpose with their website is to enable users to easily and enjoyably connect and communicate with friends, family and communities. In particular, the platform GMP includes the following functions: (1) building and maintenance of a personal profile; (2) building and maintaining friendship network; (3) publishing and sharing posts, photos, and updates; (4) private messaging; (5) receiving updates through notification and implementation of a personalized content feed. Users' comfort and ease in completing these core actions should therefore be crucial for the success of the site.

Personas

Below are three representatives of the primary survey respondents (n = 30) presented as personas (who, what, why, how) to help understand the three segments on frequency of use (Daily, Weekly, Rarely/Never) and core pain points mentioned in **Section 2.3**.

Attribute	Persona 1: Md Arif Mahmud Oyion
Age / University:	23 years old, INTI International University, Malaysia
Occupation	Undergraduate Student
Facebook Usage	Daily, mainly through the website on a laptop
Survey Responses:	Gave the Registration Page a rating of Dissatisfied, ("Too many fields at once"), and preferred a step-by-step form. Rates the Home Feed as Dissatisfied and prefers ads to be moved to the side saying, “Ads shown in the middle of the dashboard.” Found the Friend Request Page to be

	Dissatisfied, due to the Accept/Decline buttons being too close together and wanted them to be spaced out more.
Behavior	A frequent daily user who's biggest problem is having interruptions through common surfing experience (ads in between feeds, risk of crossing into “friend requests”).

Attribute	**Persona 2: Chia Kim Hua**
Age / University:	21 years old, INTI International University, Malaysia
Occupation	Undergraduate Student
Facebook Usage	A few times a week
Survey Responses:	The Registration Page was rated as "Neutral" with one specific concern identifying, "Error messages are sometimes unclear”, and they would like the form to be broken up into simpler steps. Also criticized the Friend Request Page accept/decline buttons for their proximity to each other, instead suggesting separating the friend requests from suggestions.
Behavior	A less common user who's more strongly impacted by confusing moments (such as a confusing registration error) due to less frequent use of the interface, and thus less of a context to work with.

Attribute	Persona 3: Md Sadek Hosen
Age / University:	24 years old, American International University-Bangladesh
Occupation	Undergraduate Student
Facebook Usage	Rarely
Survey Responses:	Found the Registration Page to be Dissatisfied ("Too many fields at once") and liked a step-by-step form more. Marked the Friend Request Page "Dissatisfied" (due to request being intermingled with suggestions) and would like to see this page separate. Dissatisfied with the Notifications Page was also mentioned, as it is 'Hard to tell new from old' notifications and would be nice if these were more clearly highlighted. Also rated the Settings Page as Dissatisfied.

Behavior	This is a rare visitor who is most sensitive to friction, since he rarely logs in, any form that isn't clear and any info that isn't sorted wins him back faster than a frequent user.

2.2 Analysis for All Research Methods

This study employed a structured, close-ended online questionnaire with 30 users of the Facebook website (current or past) as the main method of research. The Close-ended forms of questions were opted for as they require minimum time from the respondents to answer and allow direct conversion into charts, which helps to make objective design decisions based on evidence, avoiding personal opinion (Nielsen Norman Group, 2024a). Three questions were asked about each of the nine interface pages: likelihood of satisfaction (Dissatisfied / Neutral / Satisfied), primary problem they had with that page, and type of change they'd like to see to that page. The salient results are summarized and discussed below. The corresponding charts created automatically by a Google Form should be placed at each of the figures.

Login Page

There were **13.3%** Dissatisfied, **26.7%** Satisfied and **60%** Neutral for the Login Page. Asked specifically about which types of problems occurred, **53.3%** replied to none of the problems listed on the page, **30%** replied that the page appeared too plain, with the rest of the answers stating minor problems. In keeping with this **43.3%** replied they preferred to leave the Login Page as is (the largest single answer). This means that it's not a particularly exciting page, but it's not a nitpicky grind or anything that is annoying to use, so it wasn't a top candidate for redesign.

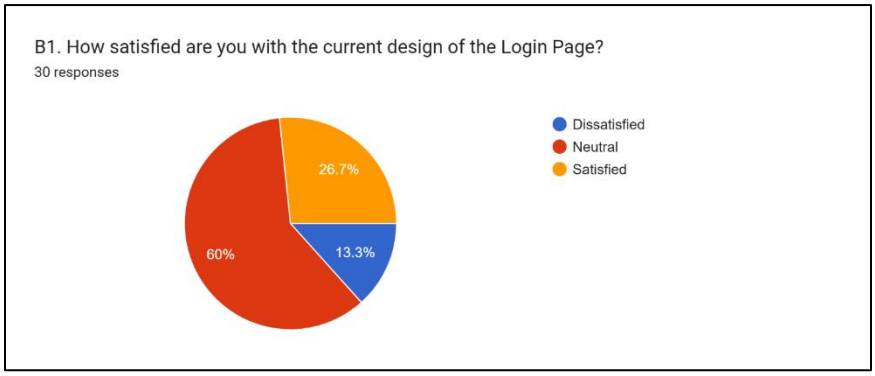

Figure 1: Login Page — Google Forms response chart 1 (n = 30)

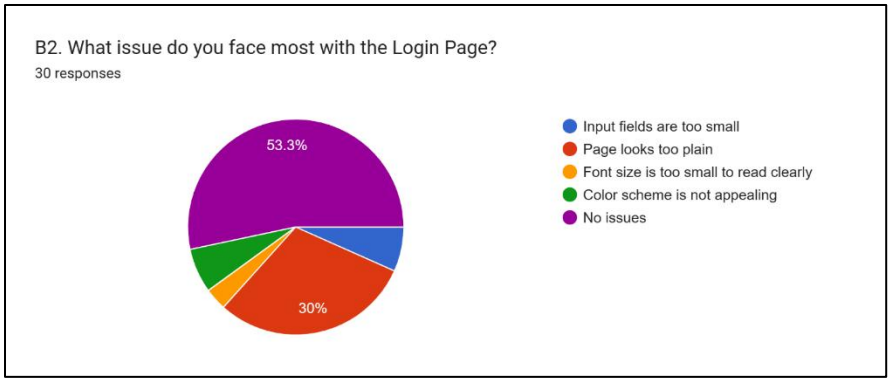

Figure 2: Login Page — Google Forms response chart 2 (n = 30)

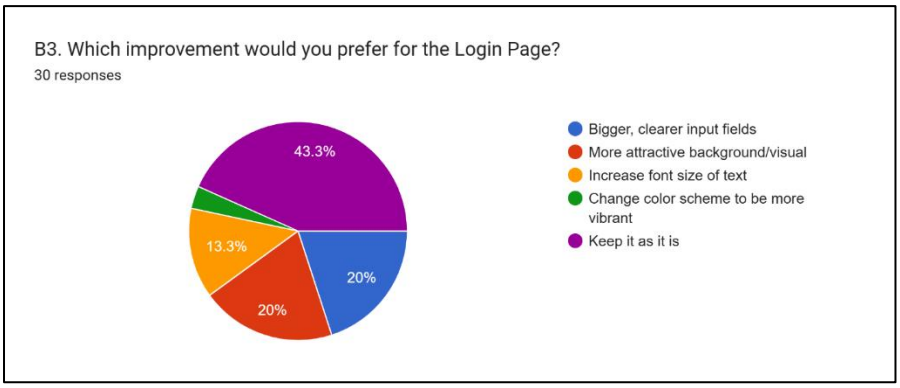

Figure 3: Login Page — Google Forms response chart 3 (n = 30)

Registration Page

A similar pattern was observed on the Registration Page – although the percentage of Satisfied responses was lower **(23.3%)** than that on the Login Page, the percentage of Dissatisfied responses was greater (**20%**). Unclear error messages (**53.3%** of respondents) were the dominant problem reported. Out of all the options mentioned, more people **(33.3%)** responded that they would prefer clearer error messages. This obviously indicates that the issue on this page is not the layout, but the error handling.

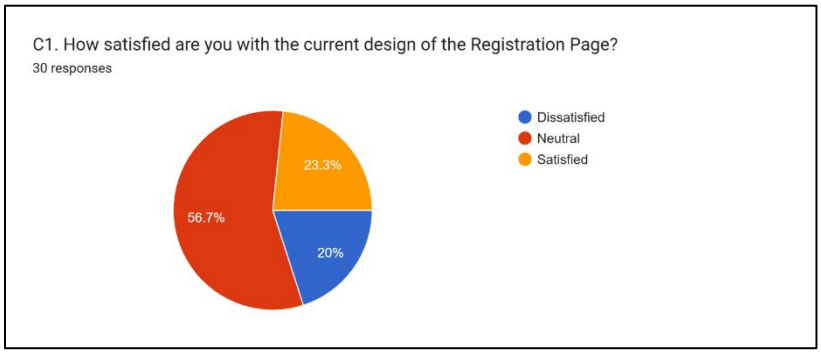

Figure 4: Registration Page — Google Forms response chart 1 (n = 30)

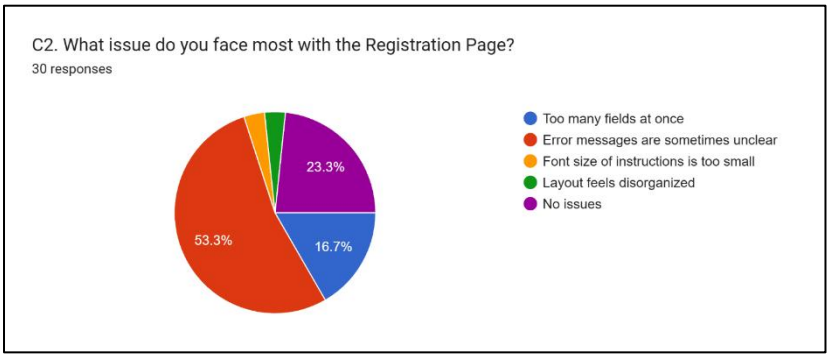

Figure 5: Registration Page — Google Forms response chart 2 (n = 30)

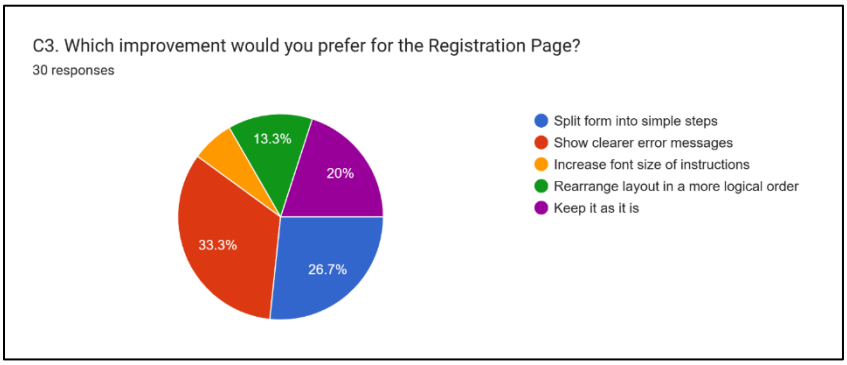

Figure 6: Registration Page — Google Forms response chart 3 (n = 30)

Home Feed (Dashboard)

The Home Feed had the highest percentage of Dissatisfied at **26.7%**, compared to **53.3%** Neutral and **20%** Satisfied. The top concern was advertisements being played between the middle of the dashboard **(53.3%)** which affects the users' browsing experience. The side of the page ad placement was the top-performing fix option in this area, with **33.3%** of respondents indicating that they would prefer this placement, the most popular choice. This was the strongest, and easiest to interpret, of the signals throughout the survey.

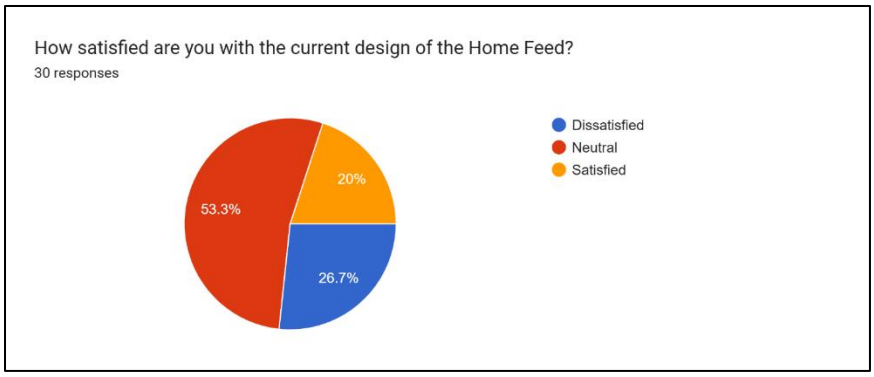

Figure 7: Home Feed (Dashboard) — Google Forms response chart 1 (n = 30)

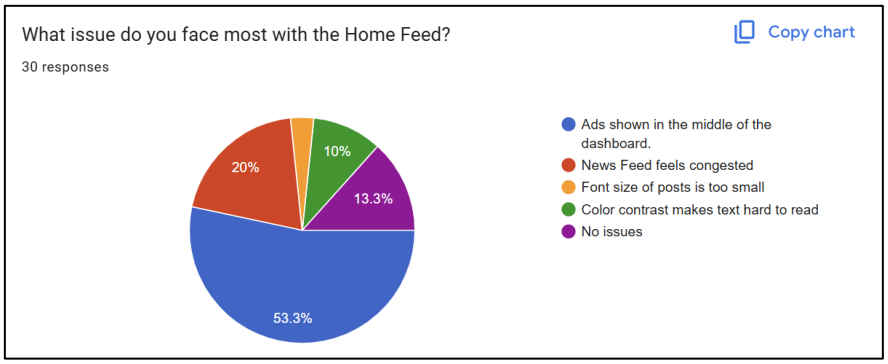

Figure 8: Home Feed (Dashboard) — Google Forms response chart 2 (n = 30)

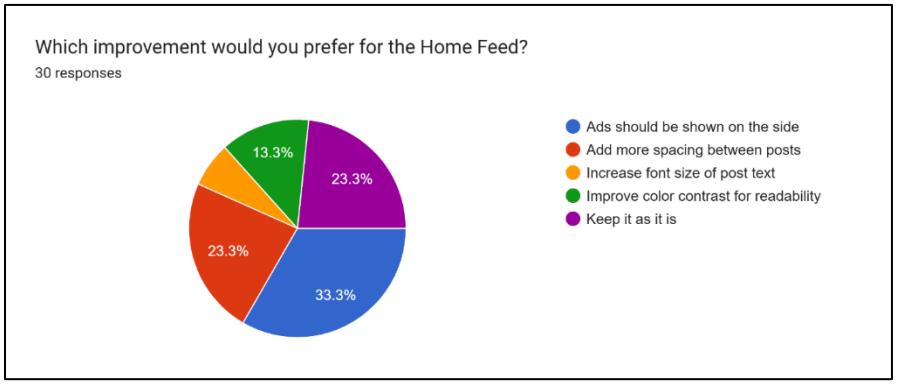

Figure 9: Home Feed (Dashboard) — Google Forms response chart 3 (n = 30)

Profile Page

The Profile Page was comparatively well with **3.3%** Dissatisfied, **60%** Neutral, and **36.7%** Satisfied the highest satisfaction score found in the study. Nearly half of responses (**43.3%**) said that there are no problems and **50%** liked to leave the page as is. As such, this page was a low priority for redesign.

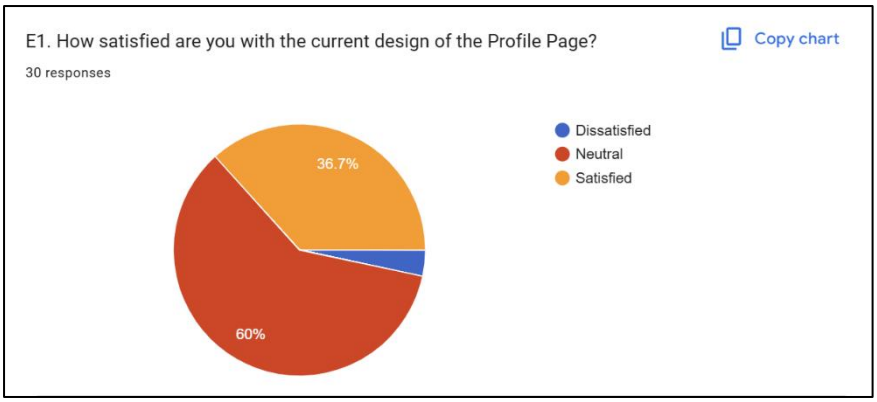

Figure 10: Profile Page — Google Forms response chart 1 (n = 30)

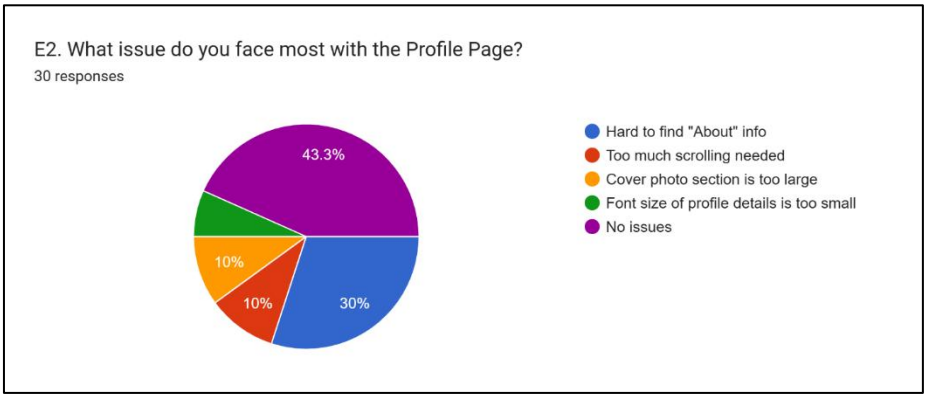

Figure 11: Profile Page — Google Forms response chart 2 (n = 30)

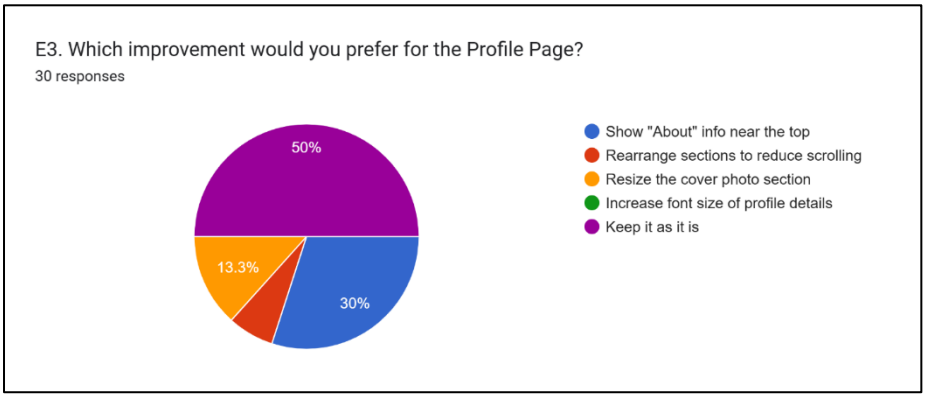

Figure 12: Profile Page — Google Forms response chart 3 (n = 30)

Friend Request Page

For the Friend Request Page there were **26.7%** Dissatisfied and **53.3%** (Neutral). The most frequent problem, mentioned by **37 percent** of the respondents, was the proximity of Accept and Decline buttons which means they are prone to inadvertent clicks. Ten percent selected a related concern requests being combined with suggestions of friends. When asked what they would like to see as their preferred fix, the two top choices combined (adding space between the buttons **(20%)** and separating requests from suggestions **(36.7%)**, were opted for by more respondents combined **(56.7%)** than the number of respondents that wanted nothing changed **(30%)**, making it a valid idea to redesign this page.

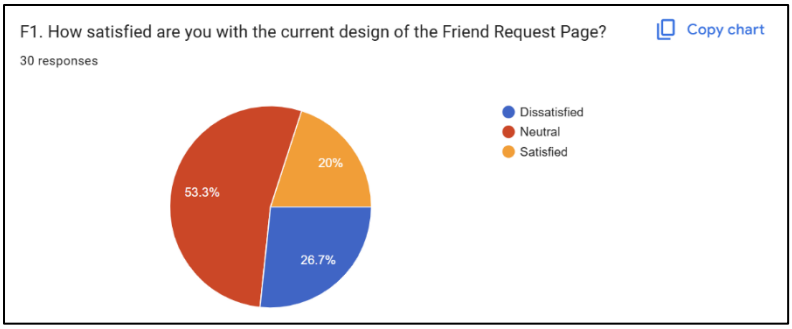

Figure 13: Friend Request Page — Google Forms response chart 1 (n = 30)

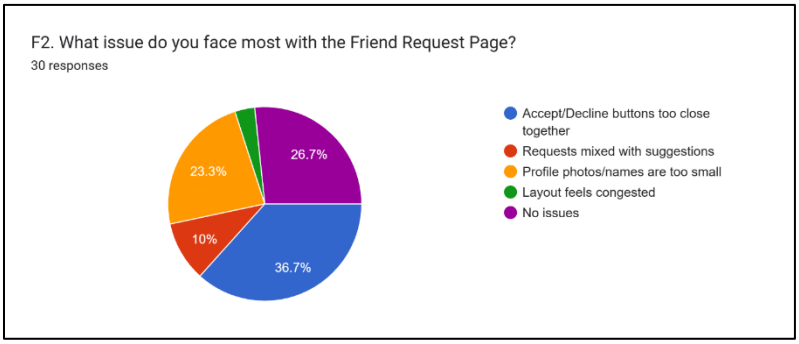

Figure 14: Friend Request Page — Google Forms response chart 2 (n = 30)

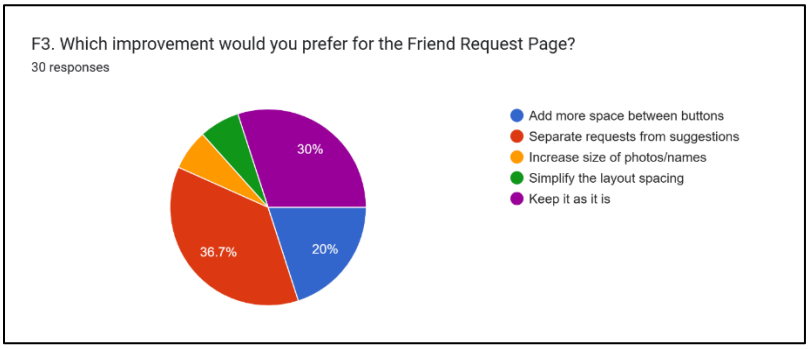

Figure 15: Friend Request Page — Google Forms response chart 3 (n = 30)

Message Page

The lowest dissatisfaction level of any page in the survey is the Message Page with only **10%** and a second highest Satisfied score of **40%**. The majority (**46.7%**) said that they experienced no problems, and the majority also wanted the design to stay as is. Thus this page was not improved in a way to go first as a page to redesign.

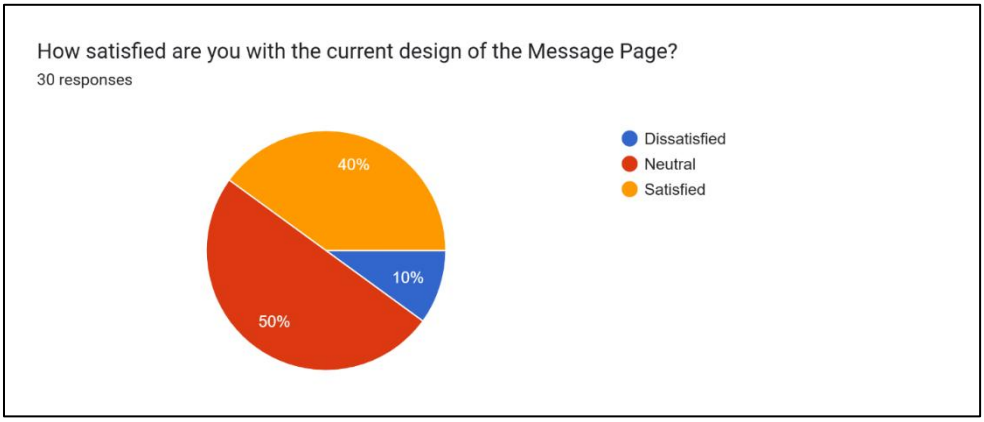

Figure 16: Message Page — Google Forms response chart 1 (n = 30)

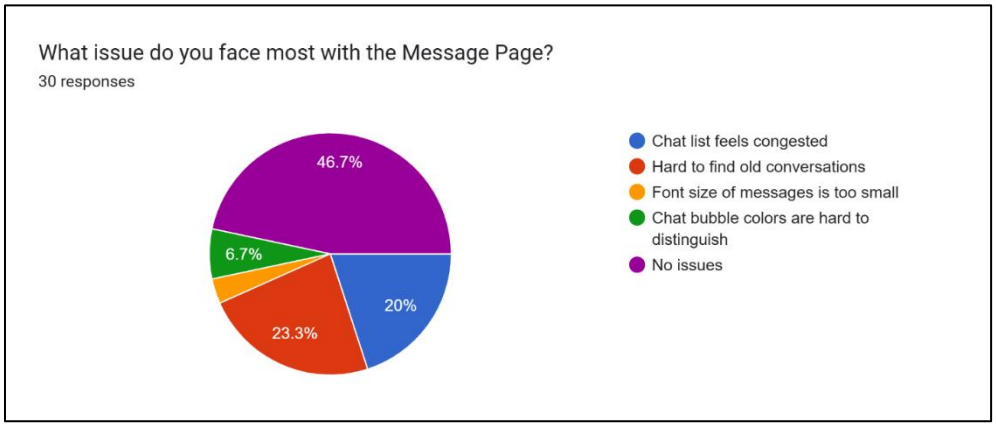

Figure 17: Message Page — Google Forms response chart 2 (n = 30)

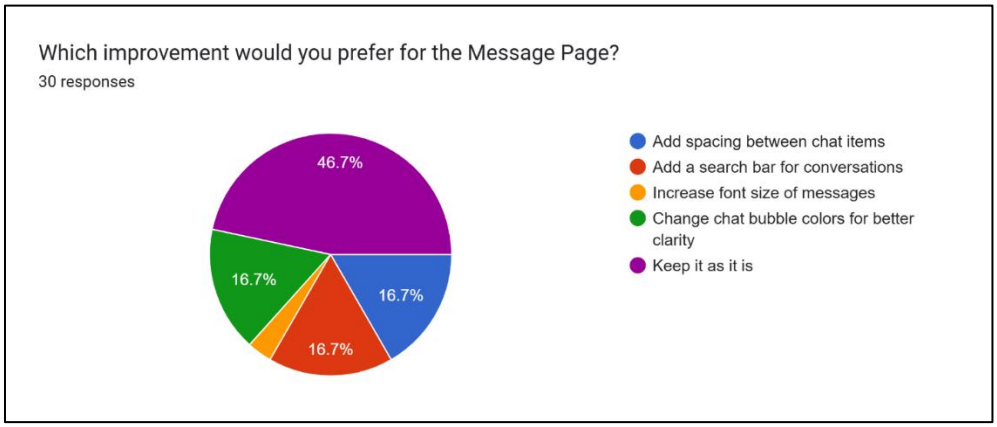

Figure 18: Message Page — Google Forms response chart 3 (n = 30)

Notifications Page

The Notifications Page noted percentages of Dissatisfied (**10%**), Satisfied (**33.3%**) and Neutral (**56.7%**). **46.7%** of the respondents said they did not have any problems with this but **23.3%** didn't know how to tell new notifications from old ones and **43.3%** didn't want to have any changes at all.

Pay close attention to unread notifies clearly' was the second highest requested improvement (**20.1%**), although there was a single most popular response (**43.3%**), 'keep it as it is', showing a specific targeted opportunity for improvement within the overall low dissatisfaction.

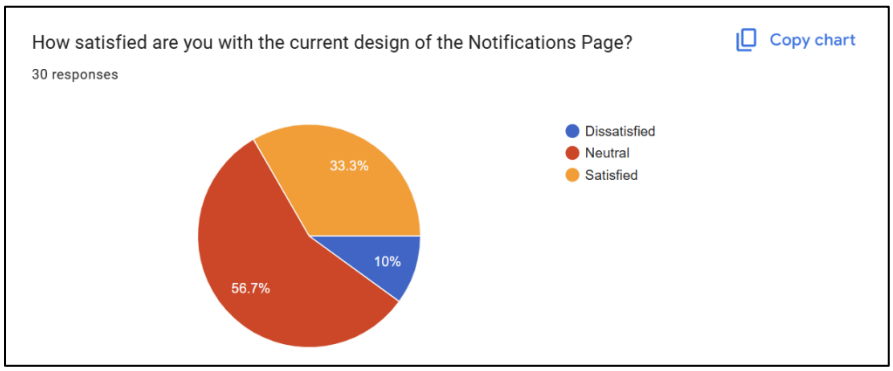

Figure 19: Notifications Page — Google Forms response chart 1 (n = 30)

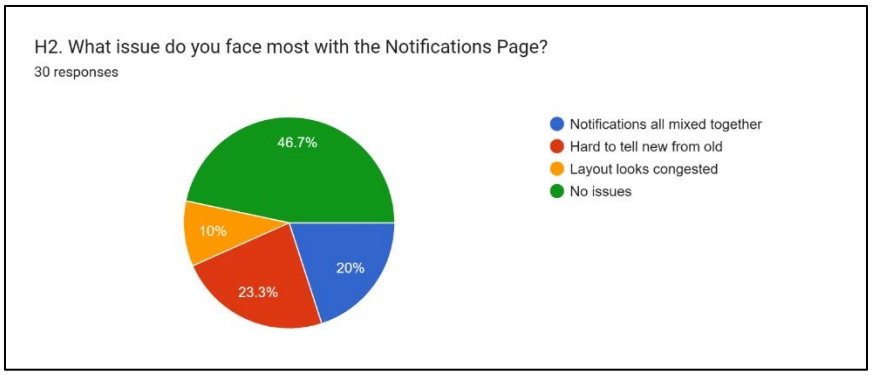

Figure 20: Notifications Page — Google Forms response chart 2 (n = 30)

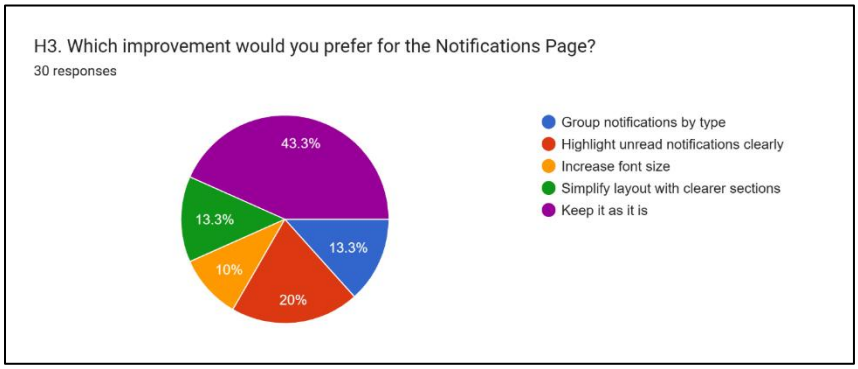

Figure 21: Notifications Page — Google Forms response chart 3 (n = 30)

Settings Page

The Settings Page revealed a balanced score with **43.3%** being neutral, **43.3%** being satisfied and only 13.3% being dissatisfied. Nearly one-half of the respondents **(46.7%)** said that there were no issues. Dissatisfaction was light, so this page was also not changed during the redesign stage.

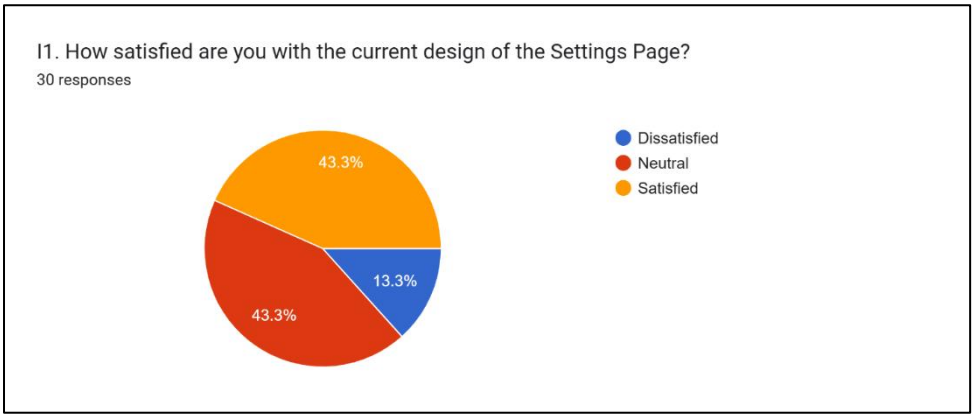

Figure 22: Settings Page — Google Forms response chart 1 (n = 30)

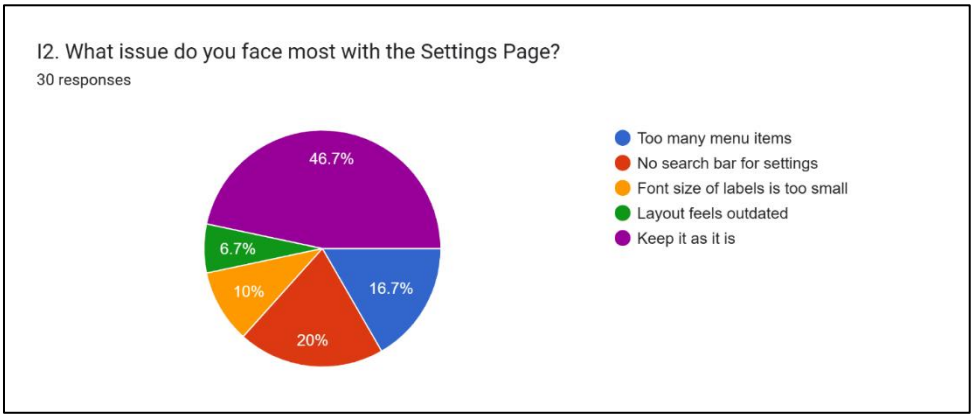

Figure 23: Settings Page — Google Forms response chart 2 (n = 30)

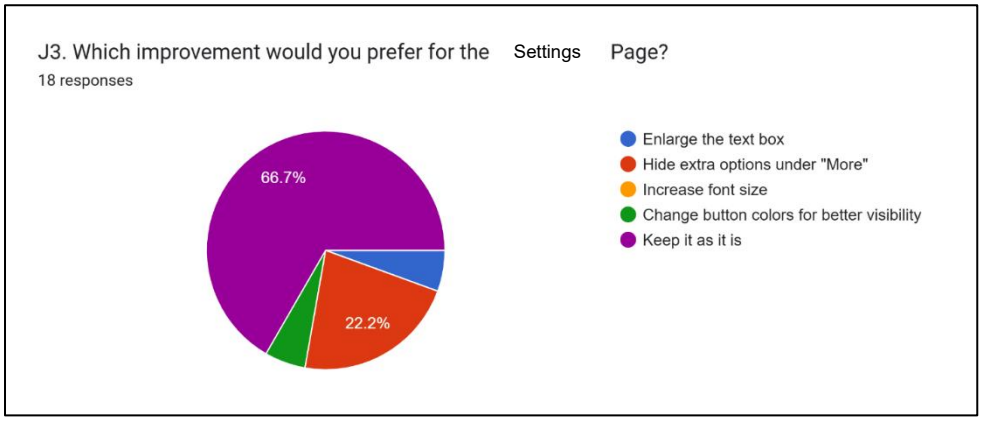

Figure 24: Settings Page — Google Forms response chart 3 (n = 30)

2.3 Hypothesis Formulation

Using a survey analysis, there were three main pain points found. Each pain for the user corresponds with a main use of the application and is expressed as a testable hypothesis to direct the re-design.

Pain Point 1: Home Feed ads that cause disruption

Main use: Surfing online and reading the news.

Hypothesis: Moving ads from the middle of the Home Feed to the side of the page will positively affect users' satisfaction with the Home Feed, as they will be able to scroll their feeds while friends and communities without having it overly interrupted.

Pain Point 2: Friend Request Actions that tend to go wrong

Main feature being used that was compromised: Social connection management (friend accept or decline).

Hypothesis: More space between the Accept and Decline buttons and separation of friend requests from suggestions under People You May Know should help to reduce users' accidental clicking on incorrect buttons, increasing their confidence in managing their network.

Pain Point 3: Clarify Error Messages on Signing-Up

Primary function impacted: Account creation/onboarding.

Research Question: Will new users be able to correct errors more quickly and register with less frustration if the error message on the Registration Page is made more prominent (such as bold red text, next to the error message).

Problem 4: Ignoring notification when you haven't read it is difficult

The main function it serves: Notifications awareness and activity tracking.

Testing the hypothesis: Show users that they can see what new activity has happened by using obvious badges and visual clues for unread notifications and messages too, since they will no longer need to open them and look their way to see new from old.

3.0 Interaction Design

This section shows the design of redeveloped Facebook website prototype according to the results of Section 2.0, which was designed on Figma. The redesign was implemented only on pages with robust and data-backed user desire for changes: Home Feed, Registration Page, Friend Request Page and the Notifications Page. The other five pages (Login, Profile, Message, Settings, and Create Post) were left unchanged since most of the respondents indicated that they were satisfied or didn't have any problems with their current design.

Prototype Screenshots and Navigation Structure

The following screenshots are from the Figma prototype file to be inserted. Each screen should be numbered as a figure and described, describing what is on the screen and how that relates to other parts of the interface.

Figma Project Design URL: https://www.figma.com/design/tw2N4MICB6PatYu2xUMqnl/HCI-Facebook-UI?node-id=0-1&p=f&t=IavYmT34WyPBH99L-0

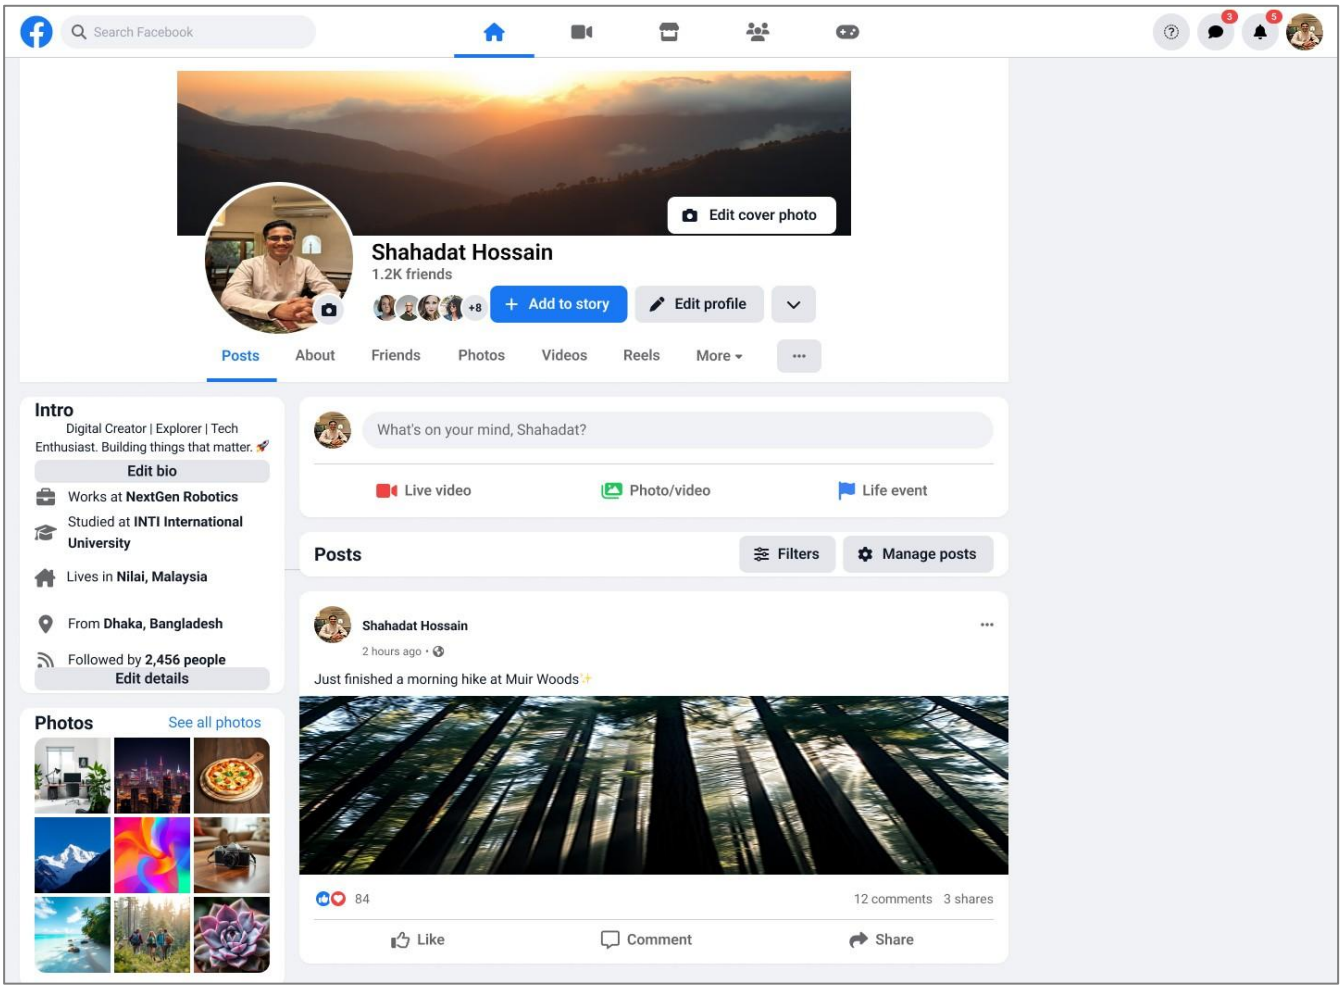

Figure 28: Profile Page (unchanged)

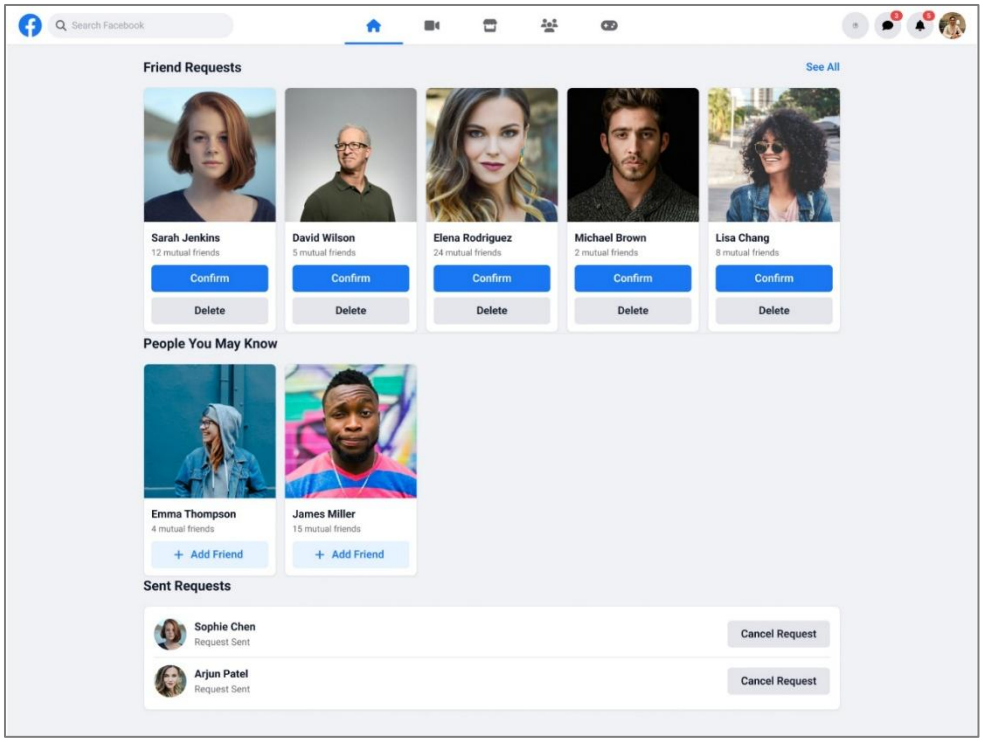

Figure 29 (a): Friend Request Page (Default)

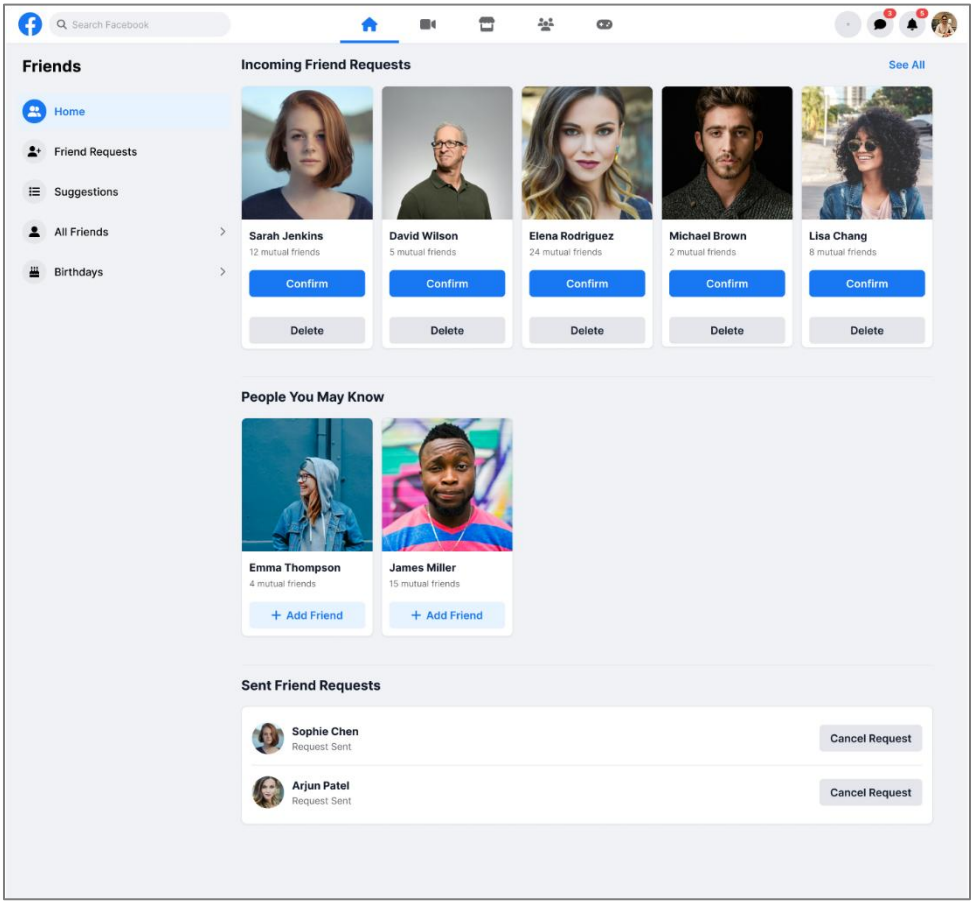

Figure 29 (b): Friend Request Page (redesigned – added spacing, separated suggestions)

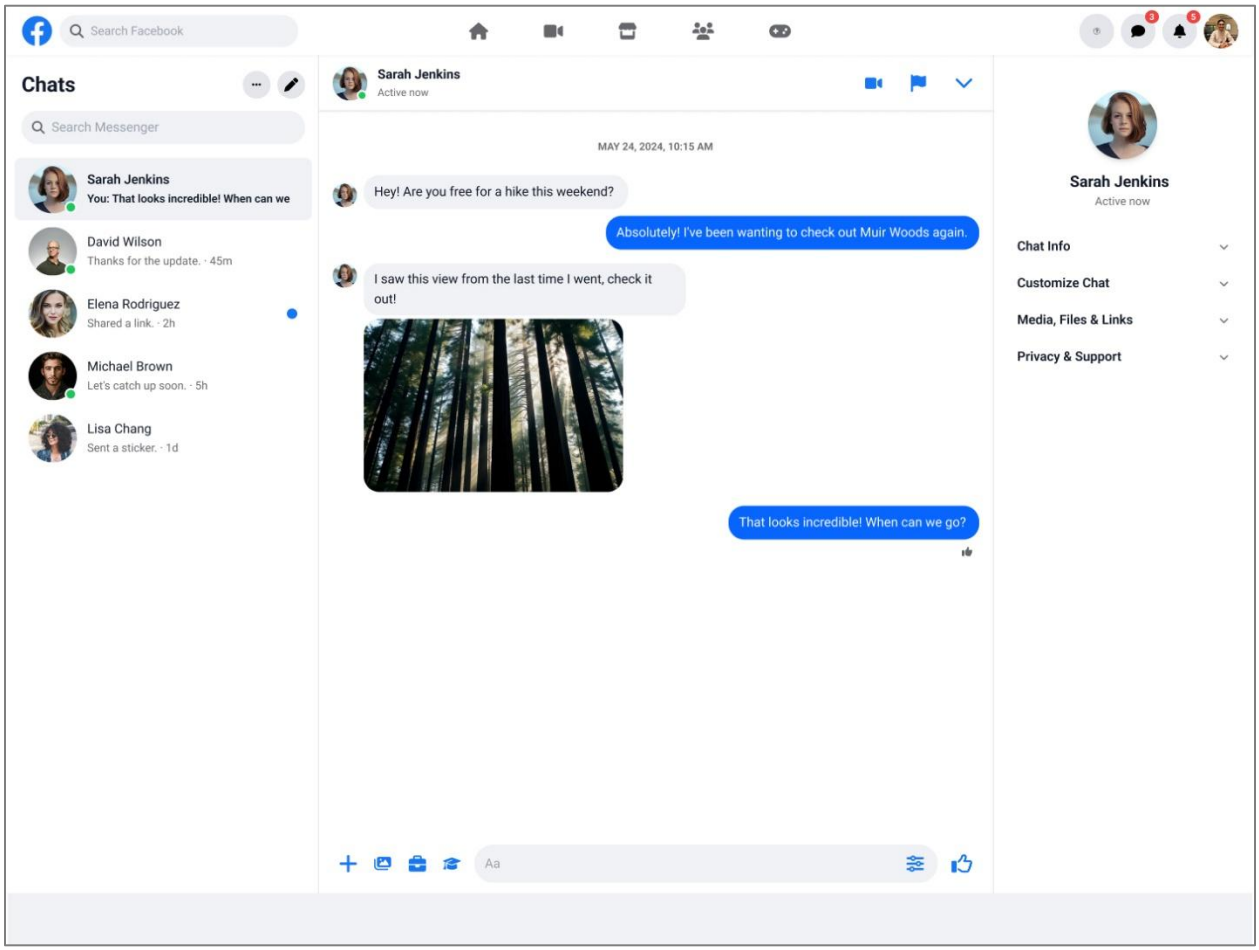

Figure 30: Message Page (unchanged)

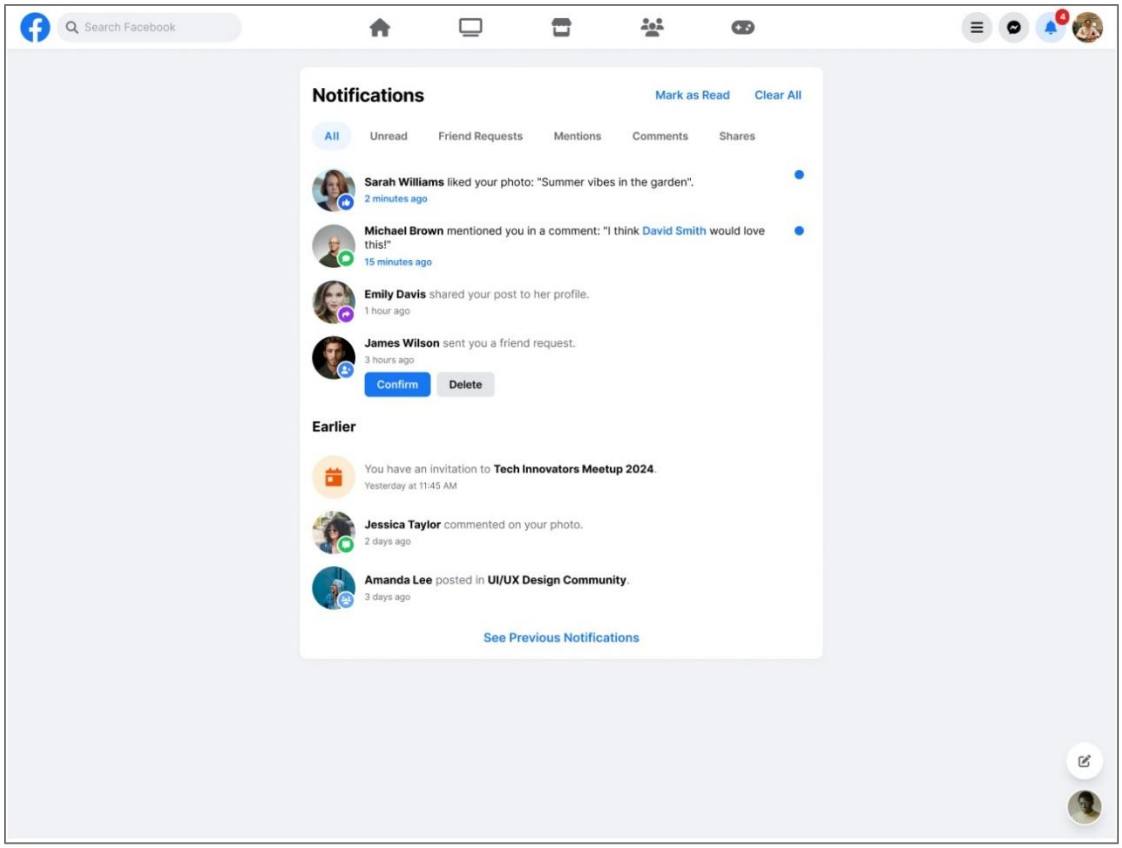

Figure 31(a): Notifications Page (Default)

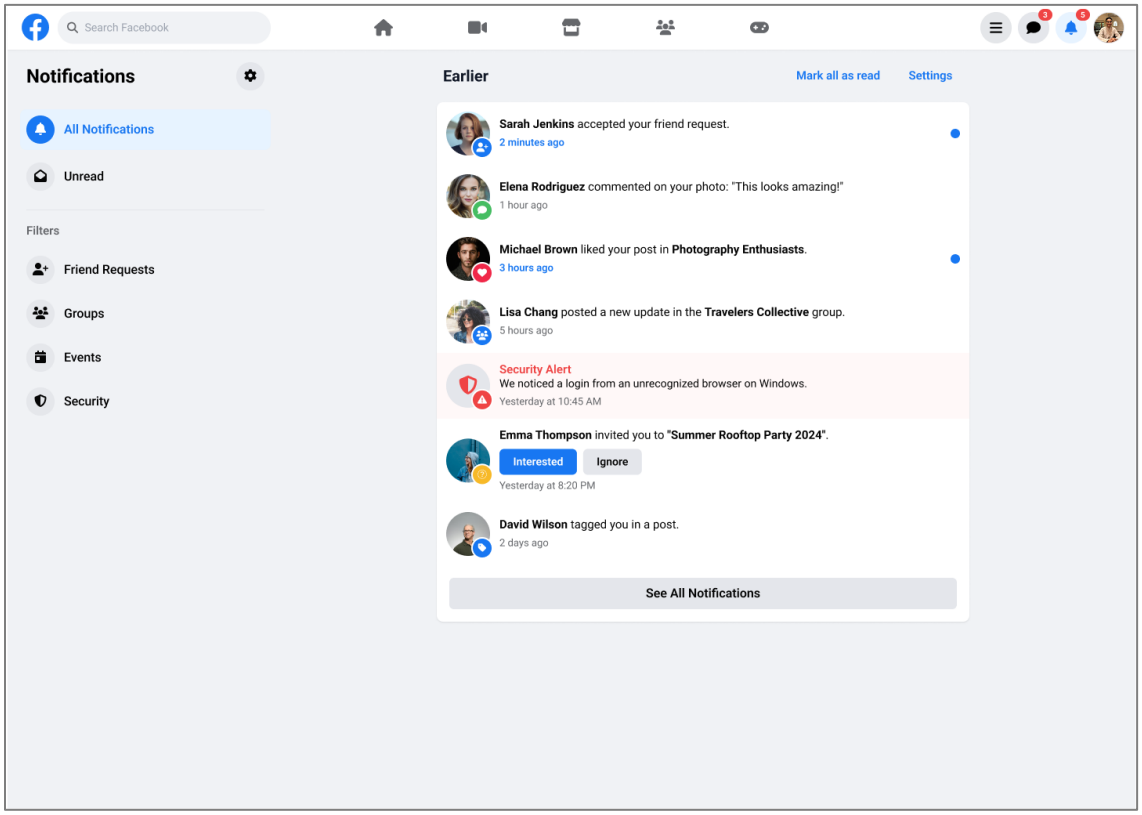

Figure 31(b): Notifications Page (redesigned – added notification badges and visual indicators for unread items)

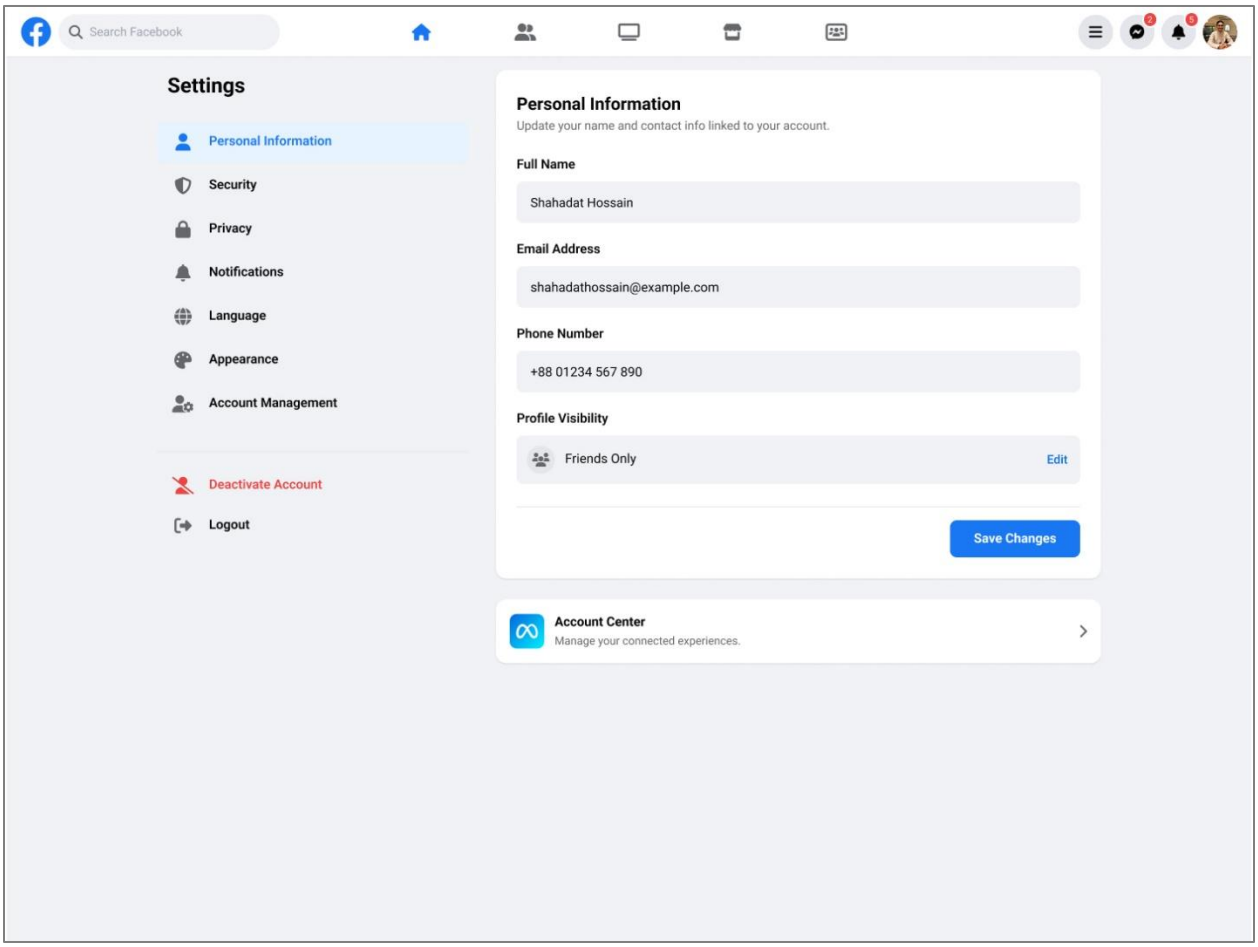

Figure 32: Settings Page (unchanged)

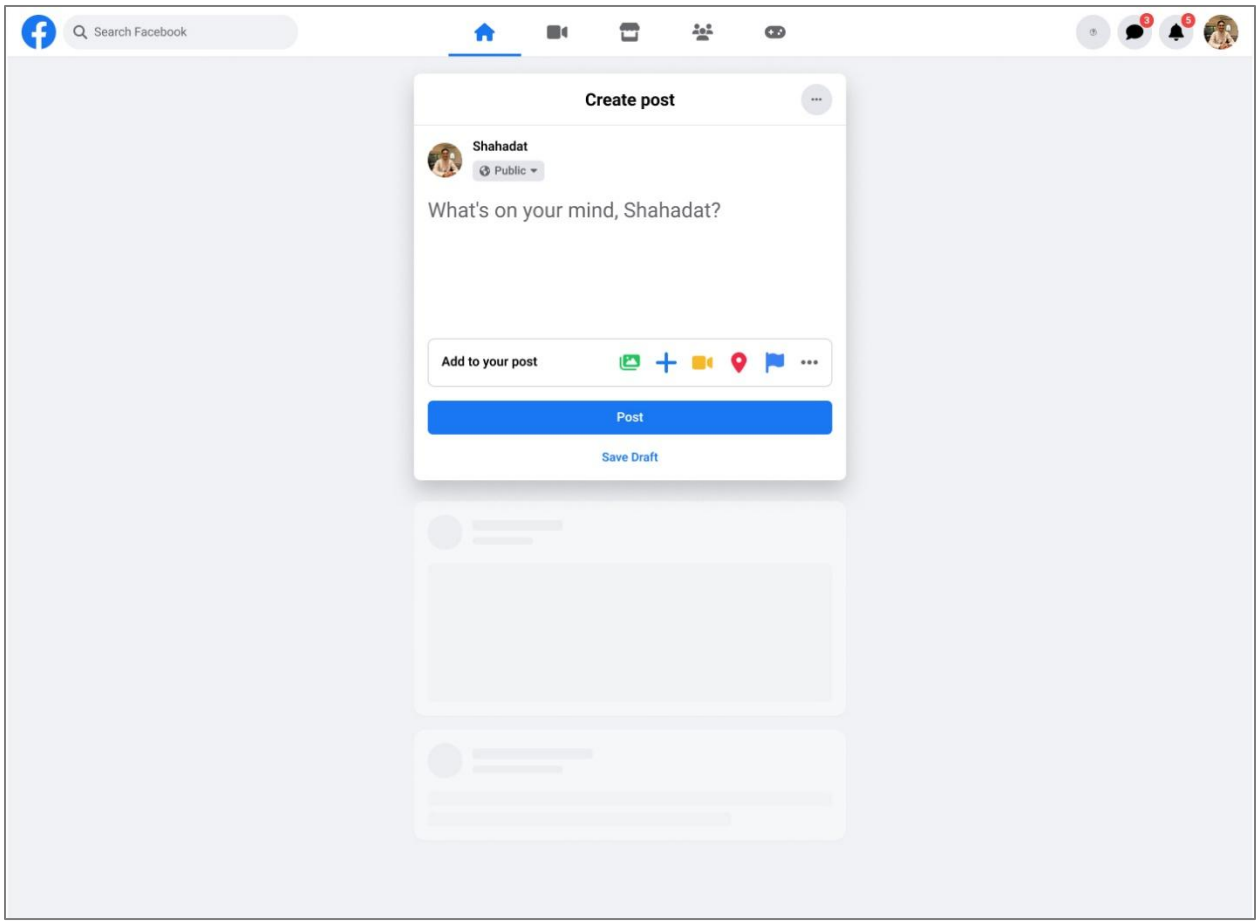

Figure 33: Create Post Page (Kept Default – Not Included in User Survey)

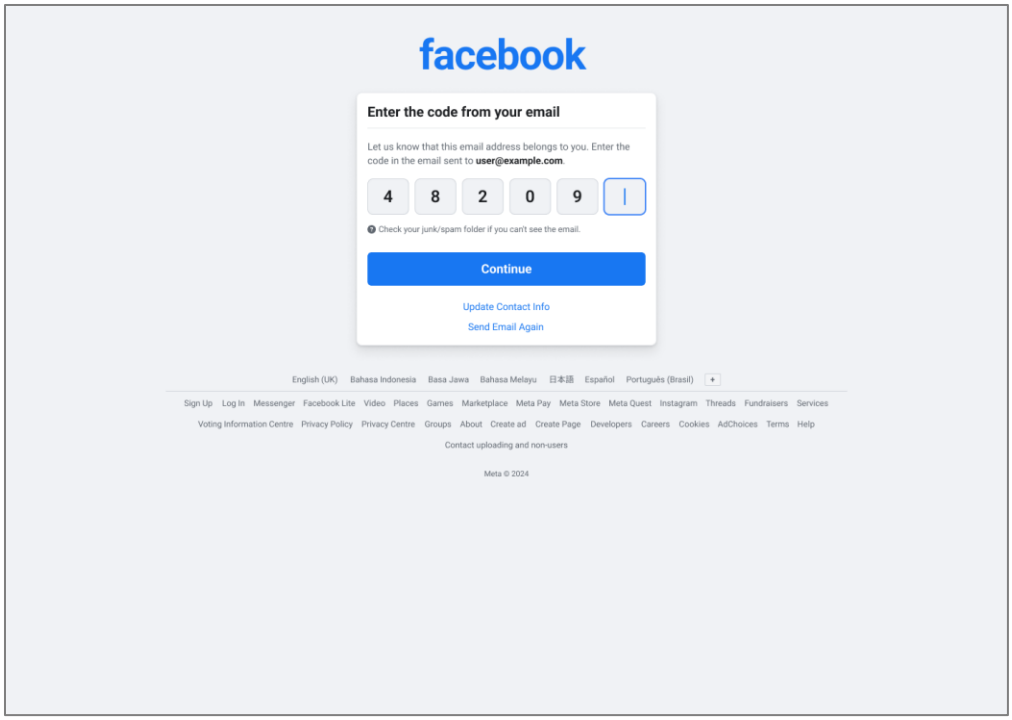

Figure 34: Verification Page (Kept Default – Not Included in User Survey)

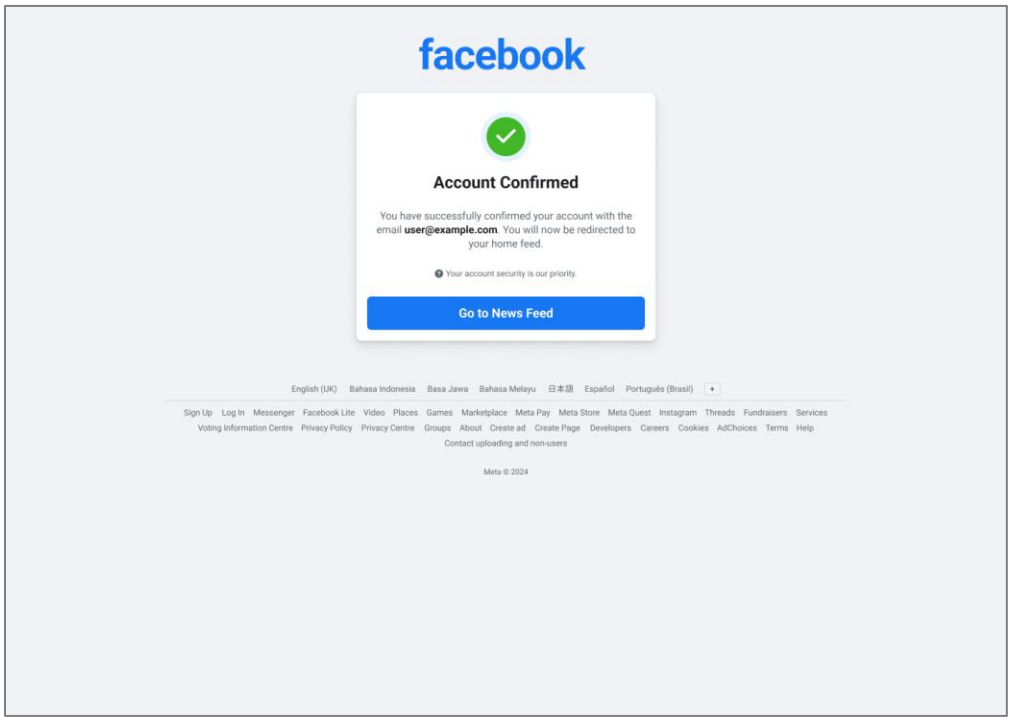

Figure 35: Confirmation Page (Kept Default – Not Included in User Survey)

The model of the Facebook website prototype has a hub and spokes type of navigation system. The user can always go from one of the other core pages starting with the Profile, Friend Requests, Messages, Notifications, Settings, and Create Post, right from the Home Feed. This ensures that no page is more than one click distant from any other page, keeping the navigation shallow and easy to learn, particularly by infrequent users like the "Infrequent Visitor" persona covered in **Section 2.1**.

The production of conceptual design for Content Delivery:

Posts, notifications and friend requests displayed on the overhauled Facebook site have a design like a card in the feed. This structure was retained from the original design, but improvements were made in two areas due to low complaint rates. First, Sponsored Content (ads) now appear as a separate column in the Home Feed and do not disrupt the stream of primary content, rather it appears as a separate column within the side of the home feed. In the second instance, all Friend Requests and "People You May Know" suggestions are now presented in two distinct lists (one for each), each featuring its own title in the Friend Request page.

Interactive Features

The redesigned prototype includes the following interactive features:

- Real time type error that appears in bold red text right under the particular input box at this point of the registration process.
- Add hover and click state to Accept and Decline buttons of Friend Request page to minimize accidental click.
- A collapsible side panel to place ads on the Home Feed - but still keep the main feed filled with friends and group content.
- Notification badges; see notification and unread messages at a single glance.
- Columns with visual markers (using bold text or colour highlight or dot marker) on unread notifications, so they are aware and can easily tell the difference between new and old notifications.

4.0 Usability Testing

A follow-up evaluation was carried out with the same research method as the original study – structured, close-ended questionnaire – with the same **30 respondents** to validate the redesigned prototype that was presented. The consistency of the respondents allowed comparisons of satisfaction levels both before and after the redesign, giving insight into satisfaction level changes because of the specific changes made to that sample, not necessarily because of a different sample of respondents being used with different expectations.

Participants

The validity of the usability was determined by a follow-up survey in which all 30 respondents to the original survey **(Section 2.2)** were invited to answer the follow-up, which is at least 3 but > 30. This also ensured that the findings were more indicative than any limited face-to-face test would be, as feedback is provided from the "wide and representative" group of real users, instead of a limited number of test sessions that are observed.

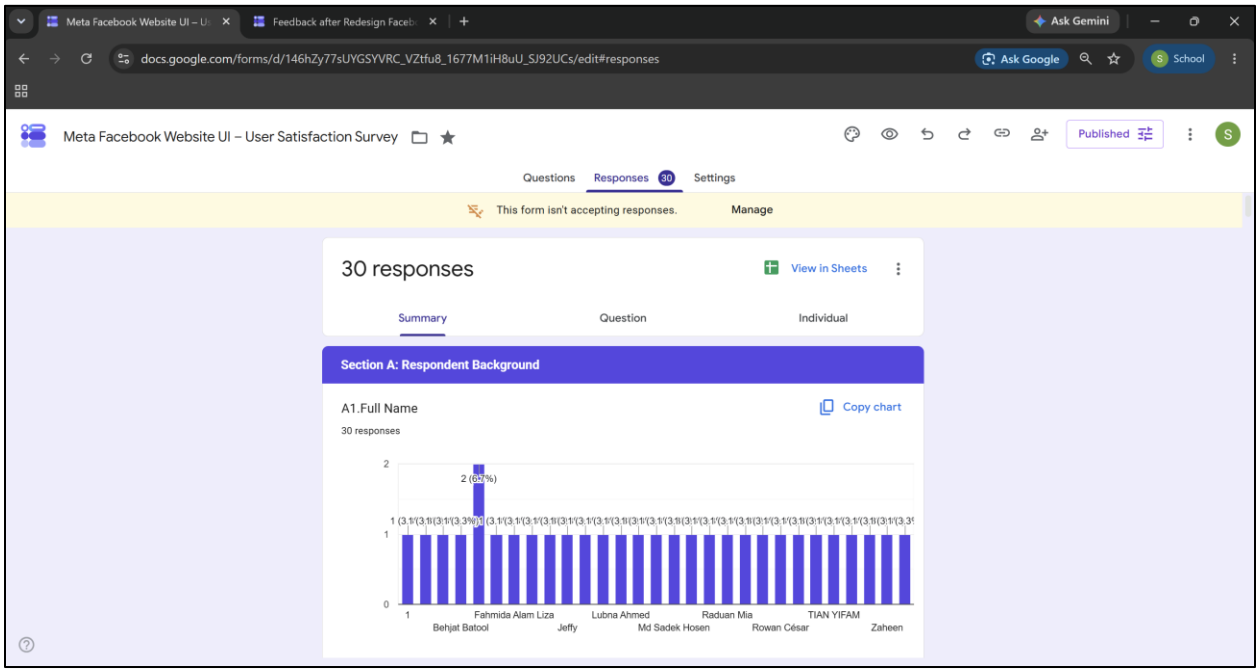

Survey Scope and Results

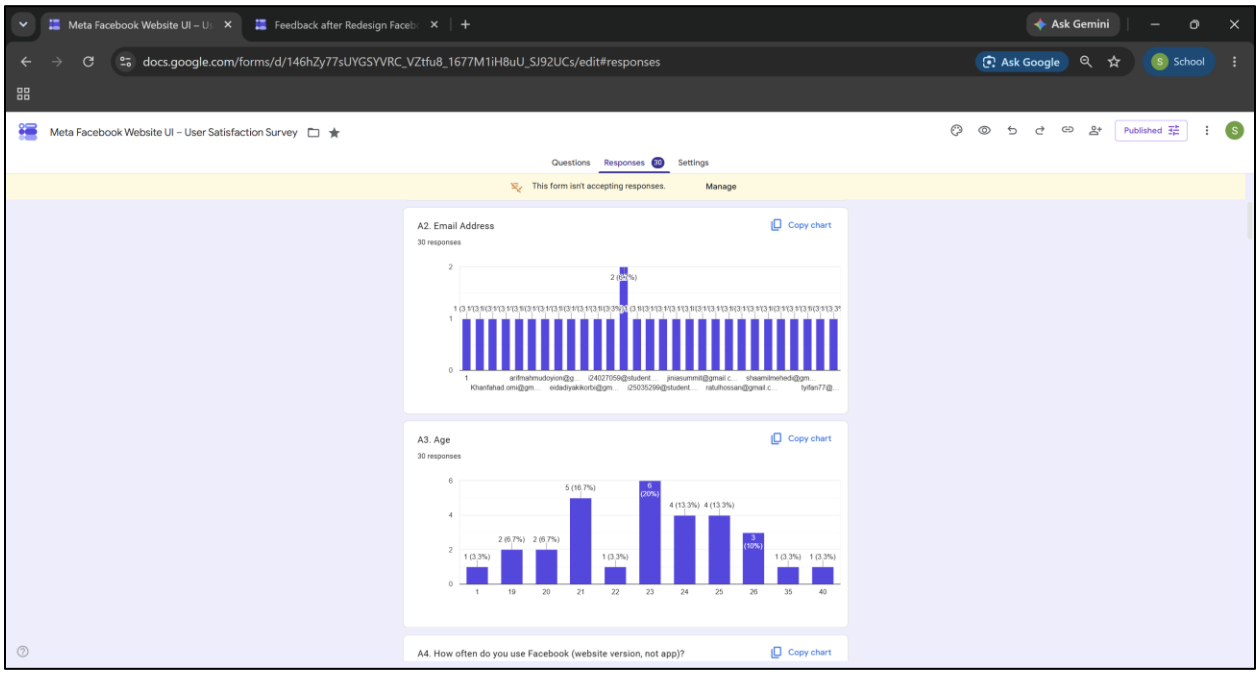

For the follow-up survey, only the four pages that were redesigned upon the outcomes of the pain points mentioned in **Section 2.3** were considered: Home Feed (the four ads were moved to the side), Registration Page (repositioned the error message so that it was clearer, bigger, and in red), Friend Request Page (added spacing/ visualization between accept and decline button and separated the friend request from the recommendation displayed) and the Notifications Page (added the notifications visibility and badges).

This second iteration of the feedback did not involve the original three-point satisfaction scale, but instead, respondents were asked to directly compare the new design with the default one and rate each redesigned page using a **1-5 scale**. This resulted in a more resonant before/after response signal than a standard Dissatisfied/Neutral/Satisfied repeat would have, as it was able to pick up how users felt, as well as whether they felt good or bad. All **4 pages** showed a **high preference** for the new design over the default and ratings were between **4.03** and **4.68 out of 5** — noticeably highest compared to the baseline results from **Section 2.2** where most of the pages were rated Neutral and dissatisfaction was highest on two pages: the Home Feed and the Friend Request Page **(26.5% each)**. A detailed breakdown of these results with the response charts per page can be found in **Section B: Prototype**, under Usability & Visual Design as well as Performance & Satisfaction.

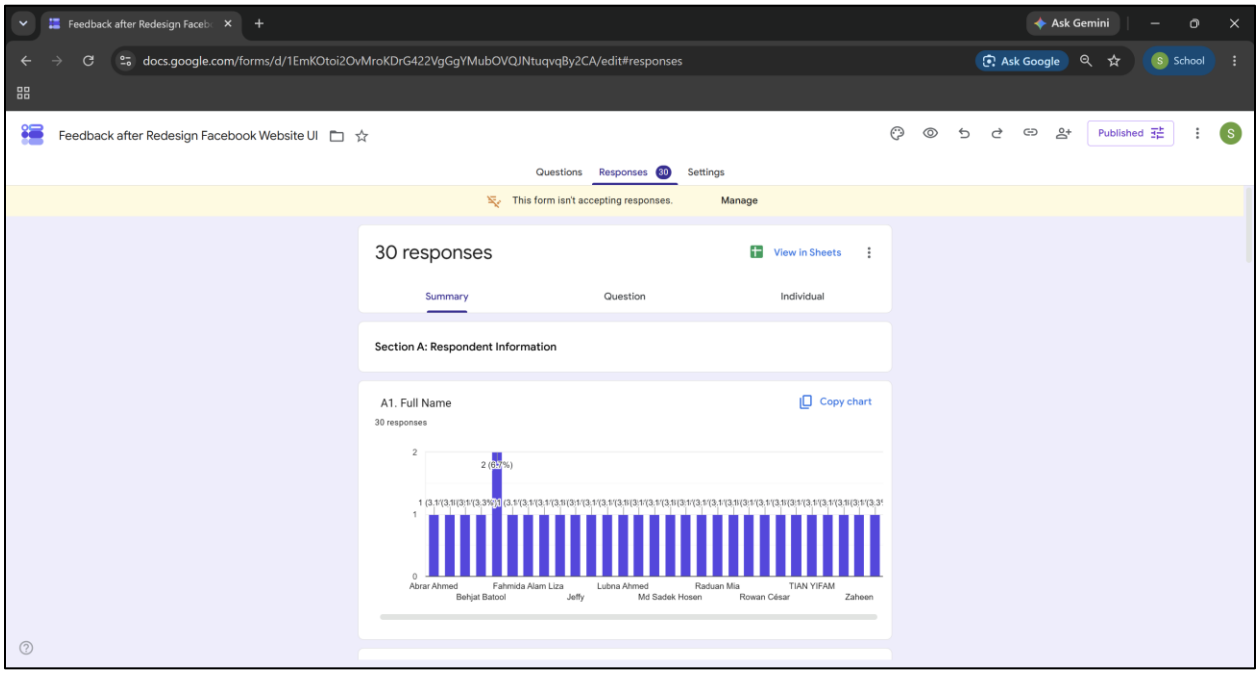

Evidence of Conduct

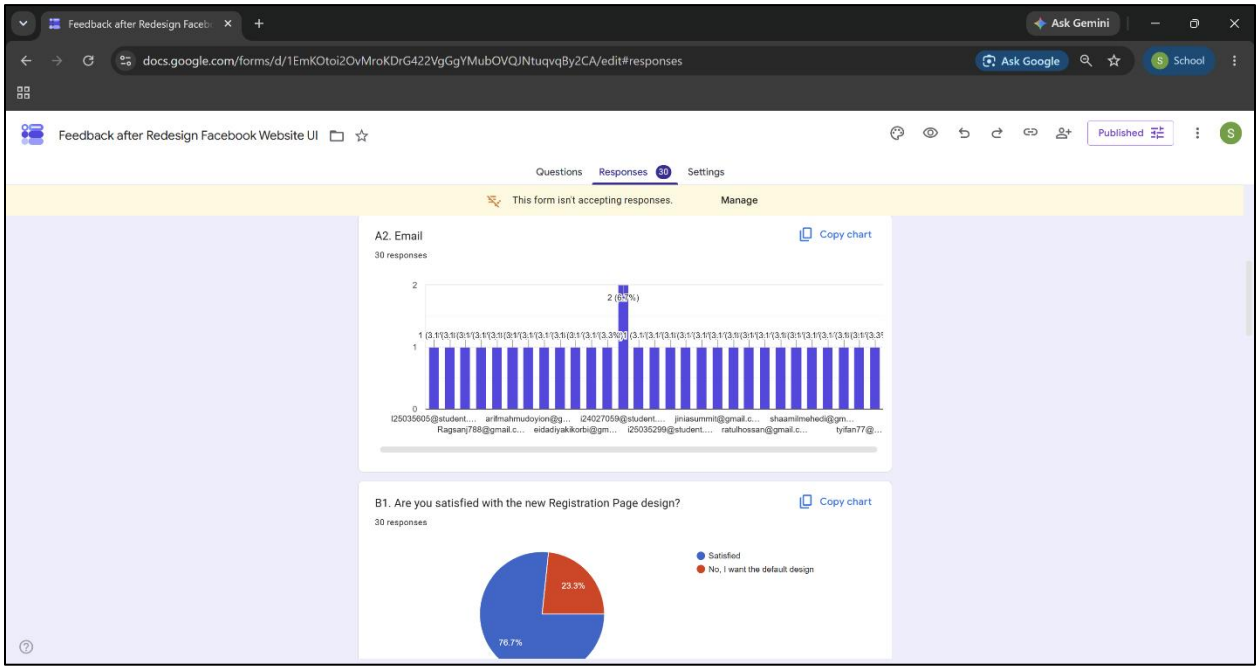

1. Screenshots of the follow-up Google Form response summary, confirming responses collected from the same participant pool

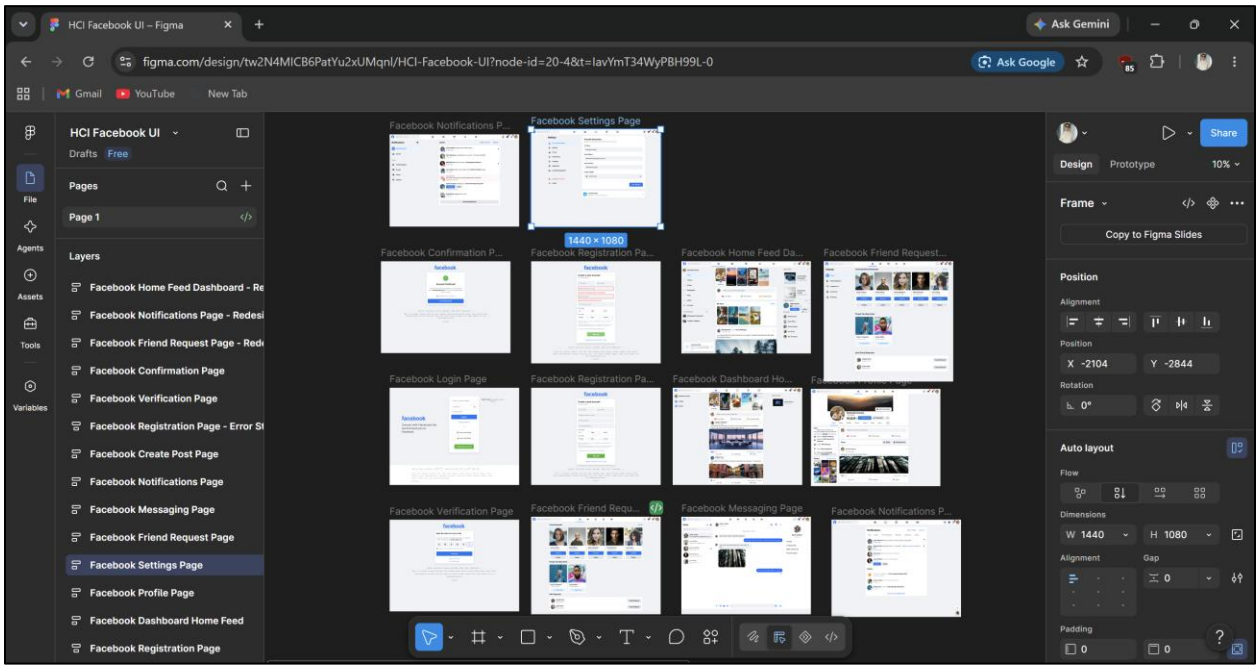

2. Screenshots of the follow-up Google Form response summary for the redesigned prototype feedback, confirming responses collected from the same participant pool

3. Screenshot of all Figma prototype designs, showing both the default and redesigned versions of the Home Feed, Registration, Friend Request, and Notifications pages

Figma Project Design URL: https://www.figma.com/design/tw2N4MICB6PatYu2xUMqnl/HCI-Facebook-UI?node-id=0-1&p=f&t=IavYmT34WyPBH99L-0

Conclusion

The aim of this research was to assess the satisfaction of Facebook website users on its interface and provide a focused redesign based on the results of the study. The first survey which was carried out with **30 people** revealed that the nine pages evaluated were mostly already functional and acceptable according to the users' level of dissatisfaction and the strong preference to "keep it as it is". But four main pain points were apparent in this data and personally affirmed by the actual users of the app, including Md Arif Mahmud Oyion, Chia Kim Hua and Md Sadek Hosen; interruptions by ads on Home Page; unhelpful error msg on Registration Page; poorly spaced Accept/ Decline buttons on Friend Request Page; and unverified notifications that were difficult to read through and hard to distinguish from old notifications. The first 4 of these pages were redesigned in Figma almost exactly as per the maximum preferences given by the respondents, and the other **5 pages** were left as is, to not introduce unnecessary changes within the interface.

The same **30 participants** then completed a follow-up survey with just the 4 redesigned pages; their full results are found in **Section B**. The results were highly positive: there was **93.7%** satisfaction with the new designs in the four pages, and an average satisfaction rating of **4.03** to **4.68 out of 5**; with the results on the pages that contained the greatest number of usability issues, the **Notifications Page (4.68/5)** and the **Friend Request Page (4.39/5)**, showing the highest level of satisfaction. We did not give a single page one star, so all the same we had no extra departures from what was already worse, and what was already bad was improved. The results find constant with the idea that it is not only feasible sensibly change your user satisfaction, but also only a minimal change redesign with information driven materials can. This is the essence of user-centered design - that improvements are better when they are rooted in listening closely to actual user feedback than when they are simply repurposed redesigns.

Section B: Prototype

The second round was a feedback test with the same participants **(30-31)** asking for feedback test to a final prototype design after redesign. This survey seeks to reply **two close-ended questions** for each of the four redesigned pages **(Registration, Home Feed, Friend Request, and Notifications**): whether the respondent is satisfied with the new design as compared to default design as well as ranking (on the scale of 1 to 5) the new design. Those results will be explored in this section under the two categories of Usability & Visual Design and Performance & Satisfaction.

Usability & Visual Design

Is it easy to navigate?

The best reception for feedback related to navigation was seen on the Friend Request Page; **93.7%** of respondents (**29 of 31**) reported satisfaction with the redesigned navigation, and the page has the highest average rating of the four tested (**4.39 out of 5**) and **93.6%** of respondents rated the page **4 or 5 stars**. This implied that a friend-request page that was more spaced out, with additional distance between the Accept and Decline buttons, resulted in less hesitation and mistakes in navigating, and directly solved the pain point of navigation discovered in **Section 2.3**.

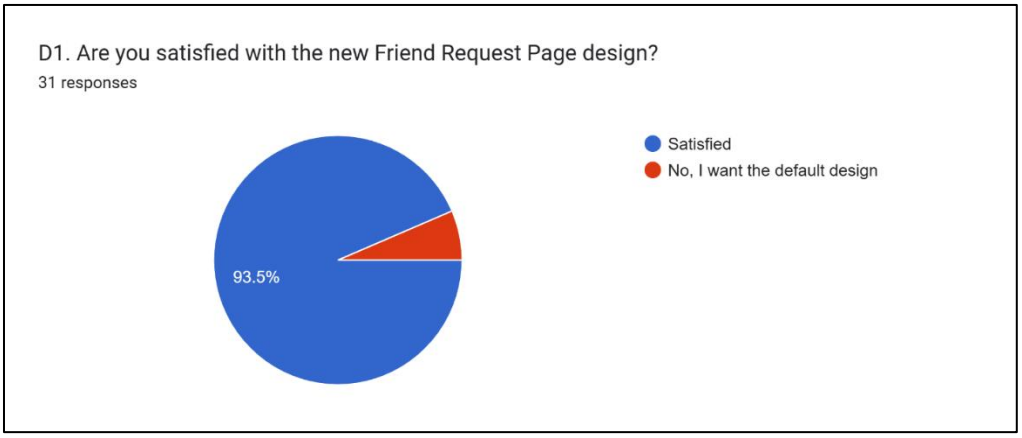

Figure 36: *Friend Request Page — satisfaction with new design (Satisfied vs. default design)*

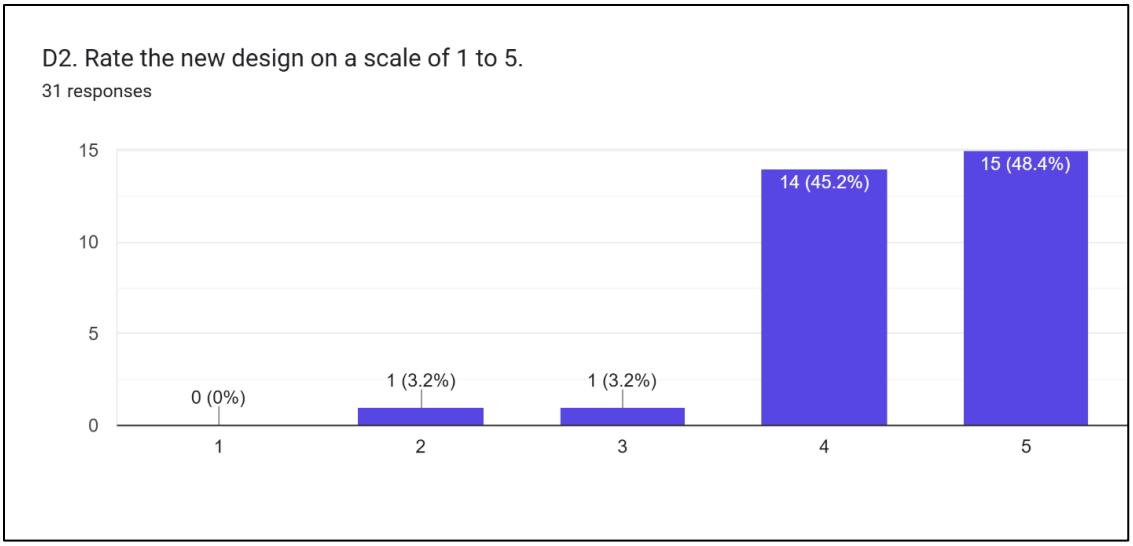

Figure 37: *Friend Request Page — rating distribution (1–5)*

The **Notifications Page** was also a strong performer, with **93.5%** satisfaction (**28 of 31**) and being rated the highest of all four redesigned pages (**4.68 out of 5**), with nearly three-quarters (**74.2%)** rated with **5 stars**. What this means is that the new visual cues and notification badges of the number of unread items were making it much easier for customers to see and find a way to do something more nearly around the clock, alleviating the fourth pain point they experienced in the study.

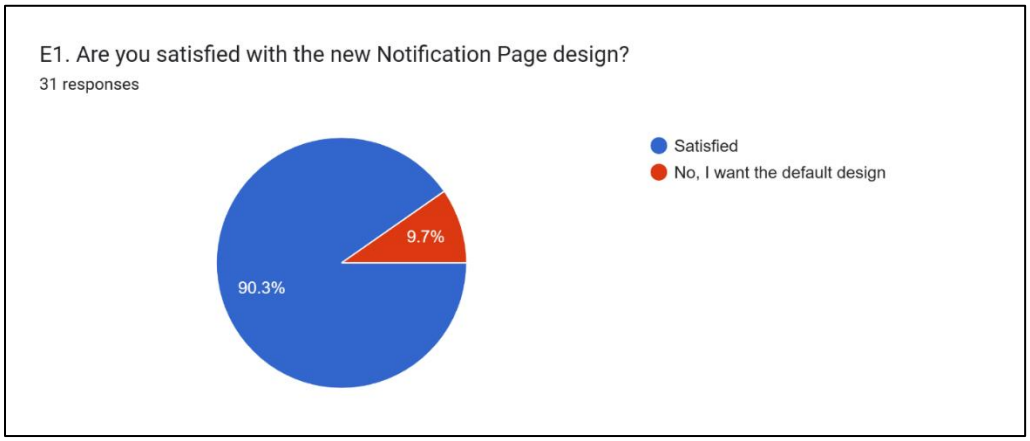

Figure 38: *Notifications Page — satisfaction with new design (Satisfied vs. default design)*

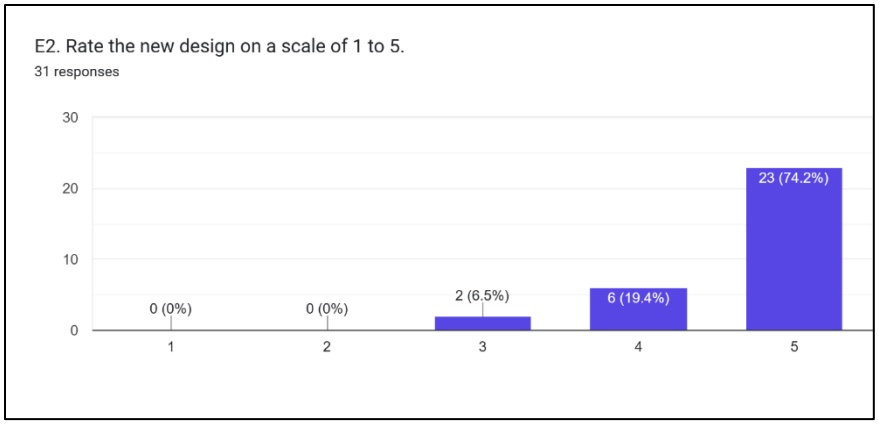

Figure 39: *Notifications Page — rating distribution (1–5)*

Is the layout pleasing?

Both the Registration and Home Feed pages scored 76.7% satisfaction (23 of 30) and an average rating of 4.03 out of 5. That may sound good, but these are the worst-performing two pages on the follow-up survey: 23.3% of respondents, on both pages, said they preferred the original format. The rating distribution was somewhat more spread out when looking at the Home Feed, indicating a diverse range of opinions: while moving ads to the side improved the page for many people, some participants only gave a 2-star rating (13.3%), offering valuable feedback to be taken into account for future changes and optimization outside of the scope of this project.

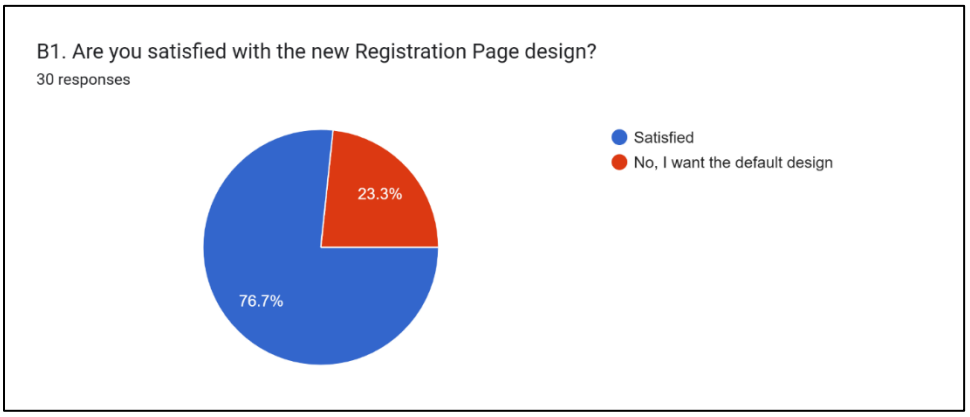

Figure 40: Registration Page — satisfaction with new design (Satisfied vs. default design)

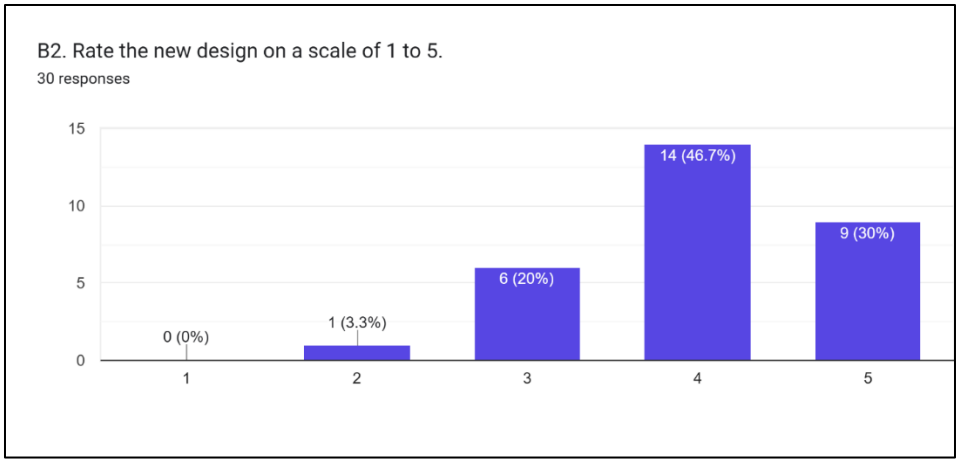

Figure 41: *Registration Page — rating distribution (1–5)*

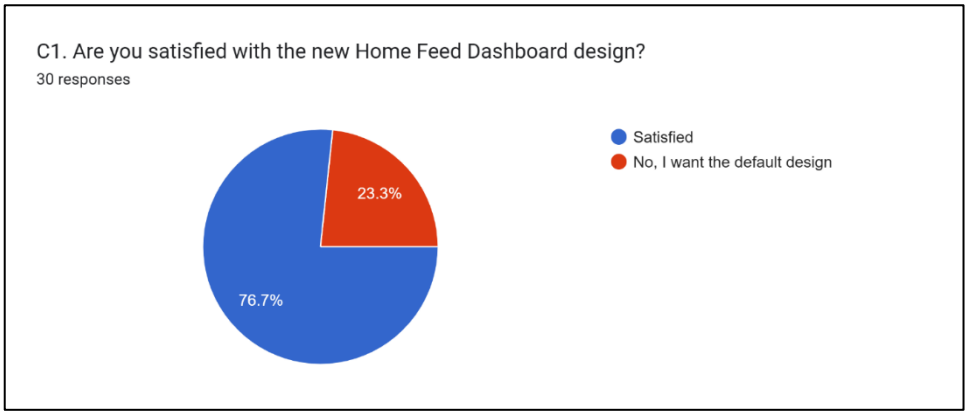

Figure 42: Home Feed — satisfaction with new design (Satisfied vs. default design)

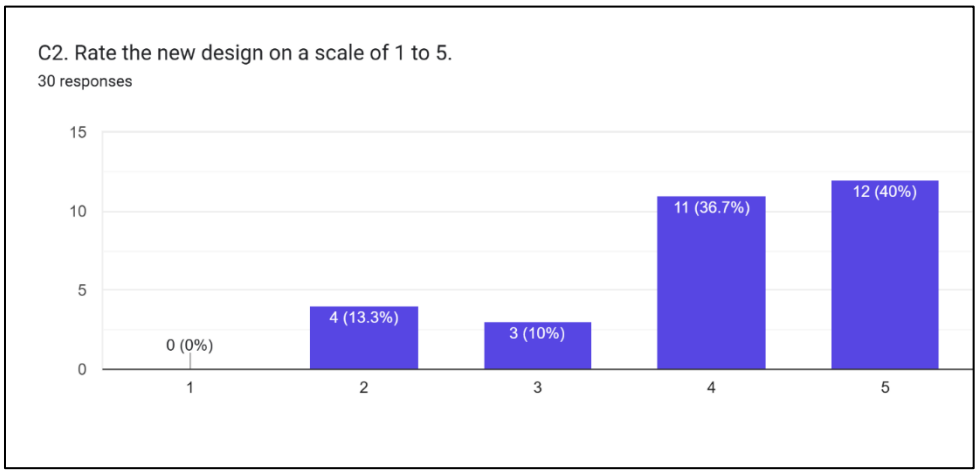

Figure 43: Home Feed — rating distribution (1–5)

Performance & Satisfaction

Is there any error?

The follow-up survey did not address specific functional errors or bugs because it was geared towards satisfaction and perceptions of design quality as opposed to technical performance. But there's been a slight improvement in that this time, there were **no 1-star reviews** on any of the redesigned pages and the most disappointing reviews were **22.8%** and below — meaning that no respondent ever felt that the new design was broken, confused, or unusable. Even the worst score for the lowest rated page (**Registration and Home Feed at 4.03/5**) is still **high** on the scoring scale, and the redesign proved to be functional from a user point of view.

Does it useful and enjoyable?

Whilst the overall outcomes demonstrate a positive reception to the re-engineered prototype, there were several highlights. Each of the four redesigned pages had the large majority of the **30 respondents** who reported pain points previously saying on average that they preferred the redesign over the default design with a satisfaction rating between **77.2%** and **93.7%** (**4/5 rating** throughout). The Friend Request and Notifications pages performed best, showing that efforts around concrete issues that were identified by users were more successful than efforts around glamour, which were issues raised by the website but not identified by users. This proves that the prototype is not only useful, but actually very useful to those who will be using it.

ASSESSMENT CRITERIA AND GRADING SHEET

Task No.	*Breakdown of assessment criteria*	*Weight (%)*	*Range of achievement (✓)*					*Marks Awarded (%)*
			Excellent	*Above Average*	*Satisfactory*	*Below Average*	*Poor*	
	Section A: Report	**70%**						
	1.0 Introduction	5	[5]	[4]	[3]	[2]	[1]	
	2.0 User experience (UX) Research 2.1 User Behaviours and Attitudes - Target audience - Website goal - At least 3 Personas	5 5 5	[5]	[4]	[3]	[2]	[1]	
	2.2 Analysis for All Research Methods - Graphs / charts and discussions of the results for website analysist	10	[9-10]	[7-8]	[5-6]	[3-4]	[0-2]	
	2.3 Hypothesis Formulation - At least 3 pain point that lead to primary functions in app	10	[9-10]	[7-8]	[5-6]	[3-4]	[0-2]	
	3.0 Interaction Design - Screenshot of the prototype must be explained and shows the navigation structure - Content delivery – conceptual design - Interactive features	10	[9-10]	[7-8]	[5-6]	[3-4]	[0-2]	
	4.0 Usability Testing - At least 3 participants - Task analysist and Results - Evidence of conduct	15	[13-15]	[10-12]	[7-9]	[4-6]	[0-3]	
	Conclusion & References	5	[5]	[4]	[3]	[2]	[1]	
	Section B: Prototype	**20%**						
	Usability & Visual Design - Is it easy to navigate? - Is the layout pleasing?	10	[9-10]	[7-8]	[5-6]	[3-4]	[0-2]	
	Performance & Satisfaction - Is there any error? - Does it useful and enjoyable?	10	[9-10]	[7-8]	[5-6]	[3-4]	[0-2]	
	TOTAL	**90%**						

3)	Section C: Individual Presentation	10%	

Student #1 Name:	Excellent	Above Average	Satisfactory	Below Average	Poor	Your Score
Content	5 ☐ Easy to follow and is complete. ☐ Presented extremely well. ☐User Research and Design choices clearly explained.	4 ☐ Structured neatly and well. ☐Easy to follow. ☐Clearly explains User Research that was conducted.	3 ☐Presentation flows in somewhat logical manner from beginning to end.	2 ☐Presentation is hard to follow.	1 ☐Unable to presentation.	
Presentation skills	5 ☐Maintains good eye contact with the audience and is appropriately animated (e.g., gestures, expression, etc.). ☐Delivery is poised, controlled and smooth. ☐Clear, audible voice ☐Good language skills and pronunciation.	4 ☐Delivery is poised, controlled and smooth. ☐Clear, audible voice. ☐Language skills and pronunciation can be followed and understood.	3 ☐ Clear, audible voice. ☐Language skills and pronunciation can be followed and understood.	2 ☐ Poor language skills and poor pronunciation – cannot be understood.	1 ☐Failed To understand and present.
